The first bat-like animals appeared about 50 million years ago.	✓	
Vampire bats are dangerous because they suck out all of your blood.		✓
Bats have fat that stores the food during the winter months.	✓	
Bats can find their way around at night because they can see extremely well.		✓

FILL IN THE CORRECT WORD FROM THE LIST

Bats are flying mammals. They probably evolved from animals that could climb trees. Over millions of years they have grown wings between their fingers and their legs. Most bats have grey or brown fur and pointed ears. When they rest they usually hang in dark rooms or caves.

Bats are active at night because it's easier for them to find food. Some eat insects and pollen, others eat birds and smaller bats. They also eat insects that are dangerous to crops.
